

 **LowCostInterlock.com**

Low Cost Interlock is an ignition interlock operator specializing in client life-cycle traceability through a proprietary calibration and data delivery system. Our goal is to improve ignition interlock programs by automating calibrations, sensor checks, and downloads at contracted service centers.

Our patented system improves sample accuracy, tracks fuel-cell life-cycles, reduces judicial time, and improves efficiency and security of data delivery to government agencies. The traceable data from client conception through program completion will ensure accuracy and improve ignition interlock programs overall.

LCI is the most efficient and effective method for allowing individuals to regain driving privileges through our straight-forward, considerate, all-inclusive approach that allows our clients to effortlessly accomplish their state-required obligations.

**ISO:9001 Certified
IGNITION INTERLOCK PROVIDER**

OPERATIONS

Starting Your TAB-720 Equipped Vehicle:

1. Remove the handset from its docking station (if applicable) by lifting upwards parallel to the mounting surface.
2. Insert a clean dry mouthpiece into the mouthpiece holder being careful to align the Location Key. For full details see section below titled "Disposable Mouthpiece". Take a deep breath, seal your lips around the wide end of the mouthpiece and blow into the TAB 720 for a minimum of 3 seconds. The *handset* will detect your breath flow and will emit a continuous tone as long as you are blowing sufficiently hard. Once sufficient breath has been blown, the continuous tone will stop and will be followed closely by a double beep. Once you have heard the double beep then stop submitting your sample. This procedure is to ensure that the sample taken comes from deep in the lungs and is therefore a better representative of the true blood alcohol level.
3. You will now see the *handset* display show the message "Analyzing."
4. After a few seconds, your breath sample will have been analyzed and, if the breath alcohol level is below the pre-set *setpoint*, then "PASS" will appear on the *handset* display. A coded signal will be sent immediately to the *Control Unit* in order to *unblock* the *ignition circuit*. Return the handset to its mounting position. You now have a *start period* during which you may start your vehicle, even if you turn the ignition off and then back on. The TAB 720 will return to its *standby mode* automatically.

RETESTS

1. If *Random Retesting* is required in your jurisdiction, at a random point within a set period following an engine start, the system will sound a series of continuous beeps. At this point you now have a set period of time to provide a further test. Once the *handset's* display shows "FIT MOUTHPIECE PROVIDE SAMPLE" alternating with the phrase "RETEST REQUIRED", blow into the unit as previously described.
2. If you provide a *valid breath sample* the handset will display "RETEST PASS" and you will be able to continue to drive.
3. Should you provide a retest sample containing an alcohol level either at or greater than the *setpoint*, this will be recorded in the device memory, the device may enter Early Recall in which you will have to return to the Service Center, the vehicle may become immobilized, and or the vehicle's horn/ lights may be activated.

CALIBRATION

The state requires periodic *Calibration and Da Download*. A *calibration* reminder will appear on the device's screen when the *calibration* date approaching; this period is set by your jurisdiction (typically 30 or 60 days).

Please note, failure to comply with the required calibration procedures may result in your vehicle becoming immobilized until reset, at your expense, at an approved *Service Center*. This process takes less than 10 minutes and typically happens at the service center where installation occurred.

REMOVAL

1. Do not remove the device yourself, this must be completed by a trained technician. If you attempt to remove the device yourself, some states will make you use the ignition interlock for a longer period of time.
2. If you meet the jurisdictional requirements for removal, contact our 24/7 call center to schedule an appointment to remove the TAB-720.
3. This process typically takes less than 1 hour and the system will be removed and your vehicle's electrics will be returned to the pre-installation condition.

24/7 SUPPORT

From Day 1 to Program Completion, Low Cost Interlock provides ALL clients **24/7 Customer Service**. Our support representatives are always available to assist you, [DAY OR NIGHT!](#)
